

Screenshot Guide

Save every screenshot in **this folder** ([figures/](#)) using the **exact filename** listed below. The README and DOCS already reference these paths, so they will appear automatically once the files exist.

Tip: capture at **1920×1080** or at your monitor's native resolution. Use **dark mode** for slides 5, 6 and 12 (they pop on dark) and **light mode** for the rest unless noted. Trim browser chrome only if you want — full-window screenshots are also fine.

Required screenshots (12 total)

#	Filename	What to capture	Page / state
01	01-hero-analyze.png	The full Analyze page with results visible for the BRCA1 (Cancer) sample. Include the verdict card, confidence gauge, probability bars and composition chart.	Click Analyze → click BRCA1 (Cancer) sample button → click Analyze Sequence → wait for results → screenshot the whole page (left input panel + right result panel).
02	02-saliency-map.png	Close-up of the Saliency Map card showing the colored DNA bases.	Same Analyze view; scroll down so the saliency card is centered. Crop to just that card if you want a clean look.
03	03-circular-plot.png	The Circular Sequence Map card with GC profile + saliency hotspots + ORFs.	Same Analyze view; scroll to the circular plot card.
04	04-similar-orfs.png	The Closest Known Sequences + Open Reading Frames cards side by side.	Same Analyze view; scroll to the bottom of the result panel.
05	05-copilot-chat.png	The Copilot page with at least one user question and one Gemini answer visible, sources chips showing.	Click Copilot → set provider to GEMINI → click any suggestion (e.g. "What is BRCA1...") → wait for answer → screenshot with the source chips visible.
06	06-mutation-lab.png	The Mutation Lab page after running a comparison (showing the mismatch table + probability shift bars).	Click Mutation Lab → click Load demo pair → click Compare Sequences → screenshot showing the mismatch table and probability shift section.
07	07-batch-upload.png	The Batch Upload page after a multi-sequence FASTA has been processed (table visible).	Click Batch Upload → upload a FASTA file (or use testDNAsequences.txt saved as .fasta) → screenshot of the result table.
08	08-knowledge-base.png	The Knowledge Base page with disease cards.	Click Knowledge Base → screenshot of the page showing all four disease cards.

#	Filename	What to capture	Page / state
09	09-pdf-report.png	A screenshot of the downloaded PDF opened in a viewer (first page, showing verdict + probability table).	Click PDF button on the Analyze page → open the downloaded genomeiq-report-*.pdf → screenshot of the first page.
10	10-dark-mode.png	The Analyze page in dark mode with results visible (same content as #01, but dark theme).	Toggle the moon icon in the top-right → re-analyze BRCA1 → screenshot.
11	11-user-manual.png	The User Manual page with at least one section expanded.	Click  User Manual → expand the first "Analyze" details block → screenshot showing the structure of the manual.
12	12-presentation-slide.png	One slide from the Presentation page (any slide works — slide 4 "Architecture" or slide 7 "Performance" look great).	Click  Presentation → press → arrow key 3 times to reach slide 4 (Architecture) → screenshot the entire slide frame.

Optional bonus screenshots

These are not referenced in the README but can be useful for the project defense / poster:

Filename	Description
bonus-confusion-matrix.png	Open models/training_metrics.json and render the confusion matrix (or take a Jupyter notebook screenshot).
bonus-cv-results.png	Render data/processed/cv_report_k6.json as a per-fold accuracy chart.
bonus-grid-search.png	Bar chart of data/processed/grid_search_report.json results across (k, ngrams).
bonus-architecture-diagram.png	A clean architecture diagram drawn in draw.io / Excalidraw / Mermaid (see DOCS.md for the layered description you can recreate).

Tips for clean screenshots

- **Maximize the browser window** before screenshotting so the layout breathes.
- Hide any browser dev-tools / extensions that clutter the chrome.
- Use light mode for screenshots #1–9 and #11; dark mode for #10 and (optionally) #12.
- Keep all four sample buttons (BRCA1 / INS / APP / ACTB) visible in #01 — they show the project supports multiple disease classes at a glance.
- For #05 (Copilot), wait for the typing animation to finish before screenshotting.
- For #09 (PDF), zoom the PDF viewer to ~100% so text is readable but the whole page is visible.

Once you finish

After saving all 12 files in this folder, the README and DOCS will display them automatically — no further edits needed. Push the **figures/** folder to your GitHub repo and the GitHub README will show every image inline.

If you only have time for **the absolute essentials**, prioritise these 5: **#01, #02, #05, #06, #09** — they showcase prediction, explainability, AI chat, mutation lab, and PDF export in one sweep.
